# The Wrong Requests (10/150)

## The judge flagged a problem that isn't there (6 requests) (too strict)

Here are the requests that were fixed by our improvement to the compound system:

- P006: Called a samurai duel game "scary" because of fighting and wounds, but violence isn't horror.
- P040: Rated both correct games as combat because of competition and the word "battle".
- P068: Rejected a game for "no combat" only because the description calls it a wargame.
- P072: Answered "nothing scary" by pointing to player elimination, which isn't horror.
- P106: Read "players modify the rules" as racing against the clock.

Here is the one request that our change couldn't fix:

- P071: Read "casualties in battle" as players being knocked out.

## Complexity (3 requests)

- P062: Accepted a game whose card said medium, but the description says "easy-to-learn", so it's light.
- P135: Same mistake with "Simple rules". The correct game, a children's game, was also ruled out as light.
- P145: Ruled that same children's game out as light, but its description says it's complex enough for adults, so the clues conflict and the key calls it medium.

## Extraction (1 request)

- P108: "A cooperative game would be nice, but it's not a must" was treated as a requirement, so the correct game was rejected.

## Summary

We chose to fix the largest group of failures: 6 of the 10 wrong requests. In all six, the second AI call (the one that reads a game's description) wrongly decided that a game broke a rule about fighting, horror or timers. It confused related ideas, for example reading violence as "scary" or the word "battle" as combat. It judged too strictly and rejected games that were actually correct.

**The change.** For fighting, horror and timer points that only the description can settle, a "poor" verdict is now treated as "mixed". The game can still be chosen if nothing better exists. A tag on the card, such as Fighting or Horror, still rules a game out as before.

**The result.** On the 150 public requests, the score rose from 140 to 145 correct (93.3% to 96.7%), and the number of wrong requests fell from 10 to 5. No request that was right before became wrong

## Single-call model run:

((.venv) ) volodymyr@Mac p1-starter % python -m p1.run systems/single.py --requests data/public.jsonl --out results/single01
Done: 150 requests in 43.6 seconds. Your system declined 24 and failed on 0. It made 150 model calls, which cost $0.0444. The results are in results/single01/.
Your team's budget left: $17.97
((.venv) ) volodymyr@Mac p1-starter % python -m p1.run systems/single.py --requests data/public.jsonl --out results/single02
Done: 150 requests in 42.4 seconds. Your system declined 24 and failed on 0. It made 150 model calls, which cost $0.0258. The results are in results/single02/.
Your team's budget left: $17.95

## Compound Model Run:

((.venv) ) volodymyr@Mac p1-starter % python -m p1.run systems/compound.py --requests data/public.jsonl --out results/compound01
Done: 150 requests in 63.9 seconds. Your system declined 25 and failed on 0. It made 212 model calls, which cost $0.0277. The results are in results/compound01/.
Your team's budget left: $17.92
((.venv) ) volodymyr@Mac p1-starter % python -m p1.run systems/compound.py --requests data/public.jsonl --out results/compound02
Done: 150 requests in 63.5 seconds. Your system declined 25 and failed on 0. It made 212 model calls, which cost $0.0277. The results are in results/compound02/.
Your team's budget left: $17.89
